Who are you?

Open-source geospatial tools for conservation under climate change - A Koala case study

Session 1	Session 2	Session 3	Session 4	Session 5
Intro to geospatial data and tools	Downscaled climate projections	Koala SDMs	Spatial conservation planning	Making maps with QGIS
Jason Flower, Mitch Rudge, Catherine Kim, EcoCommons team	Ralph Trancoso, Sarah Chapman, Rohan Eccles	Charlotte Patterson, Scott Forrest	Brooke Williams, Caitie Kuemple	Emma Hain, Nyall Dawson, Jason Flower

Outline

https://github.com/sdesrosiers1989/ICCB_Projections

- Background on downscaled climate projections
- R scripts (~ 30 mins each)
 - Importing, plotting, subsetting climate projections
 - Calculating ensemble mean
 - Validating data and calculating bioclimatic indices
- Start installing packages while we talk!
 - terra, dplyr, sf, ggplot2, dismo, rasterVis, reshape

Queensland
Government

What is a climate model?

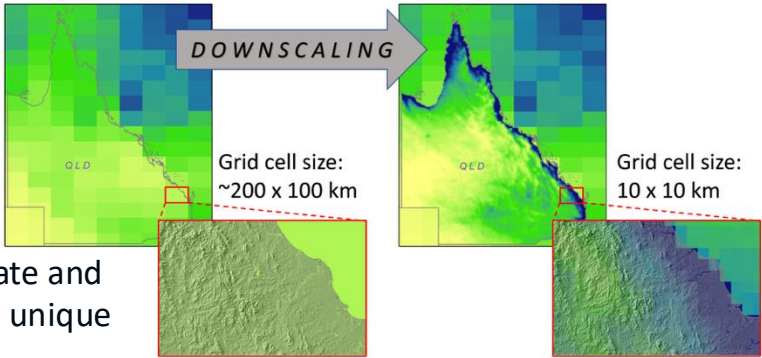

What are downscaled climate projections?

- Global climate models (GCMs) have a spatial resolution of 100 – 200km
- CMIP (Coupled Model Intercomparison Project) – major international modelling effort which feeds into IPCC reports
 - Currently on CMIP6
- Dynamical downscaling – running a higher resolution model with the inputs of a coarser resolution model (i.e., GCM) to improve the resolution of your data

Why downscaling?

1) Global models do not represent well our climate

3) QLD climate and features are unique

CLIMATE REGIONS

Equatorial	Sub-tropical	Savannah
Tropical	Temperate	Arid

4) Global models underestimate extremes and risks

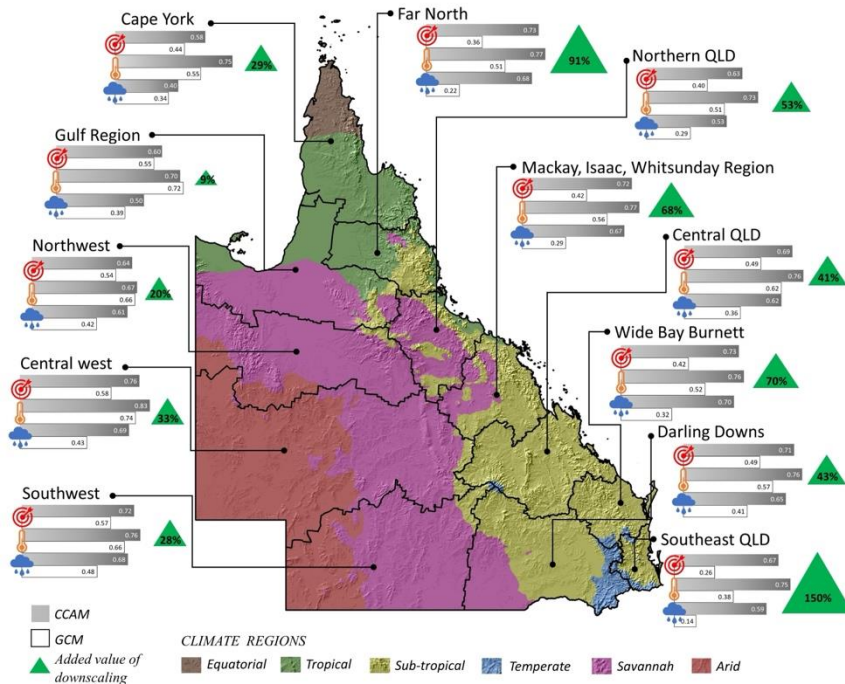

2) Global models misrepresent our landscapes and regional climate granularity

Downscaling improvements to performance

- Downscaling improved performance in all regions of Queensland
- Largest improvement along coasts, mountains, for extremes
- Data available:
<https://dx.doi.org/10.25914/8fve-1910>

Mean Climate

Heatwaves

Extreme Temperature Indices

Extreme Precipitation Indices

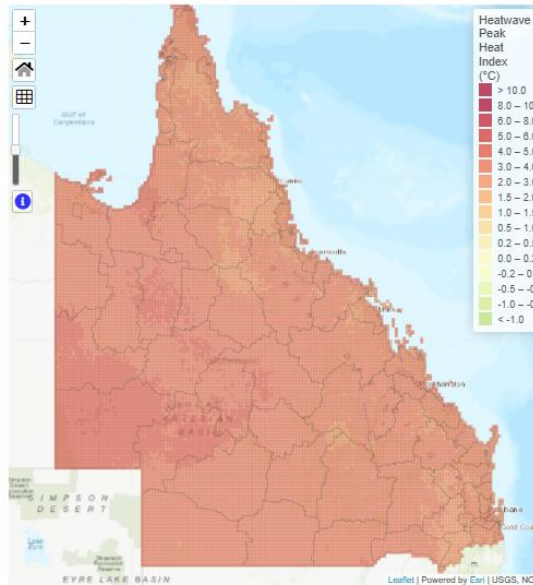

Drought Indices

Wetness Indices

Fire Weather Indices

Heatwaves are prolonged extreme humid-heat events which impact many sectors of the Australian community. Understanding how heatwave characteristics may change across Queensland in future is of critical importance.

Region Map: 1 Variable: 1
 Local Government Areas Heatwave Peak Heat Index
 Scenario: 1 Season: 1 Year: 1
 SSP1-2.6 SSP2-4.5 **SSP3-7.0** July to June 2070

Shapefile PDF

Leaflet | Powered by Esri | USGS, NOAA

Large model range!

CMIP6 Dashboard

- Three climate change scenarios (SSP126, 245, 370)
- 15 simulations per scenario
- Multiple regions
 - LGAs
 - NRMs
 - River basins
 - etc
- Multiple indices

*oc – CCAM with interactive ocean model.

What are we doing today?

- Import climate data into R
 - Three models: ACCESS-ESM1-5, EC-Earth3, GFDL-ESM4
 - Climate scenarios: SSP370
 - If you have time the data folder includes SSP126 and SSP245
- Plot the data
- Calculate climate change impacts
- Validate the data against observations
- Calculate bioclimatic indices

What does a more realistic workflow look like?

- Find your data
- Evaluate against observations
 - Chapman, S., Syktus, J., Trancoso, R., Thatcher, M., Toombs, N., Wong, K. K.-H., & Takbash, A. (2023). Evaluation of Dynamically Downscaled CMIP6-CCAM Models Over Australia. *Earth's Future*, 11(11), e2023EF003548. <https://doi.org/10.1029/2023EF003548>
- Bias correct if required for your application
 - Tomorrow you will be using bioclimatic indices our team prepared. This dataset has been statistically downscaled (5 km) and bias corrected. Data will be available on EcoCommons.
- Evaluate some more
- Calculate your indices
- Calculate ensemble mean at the end

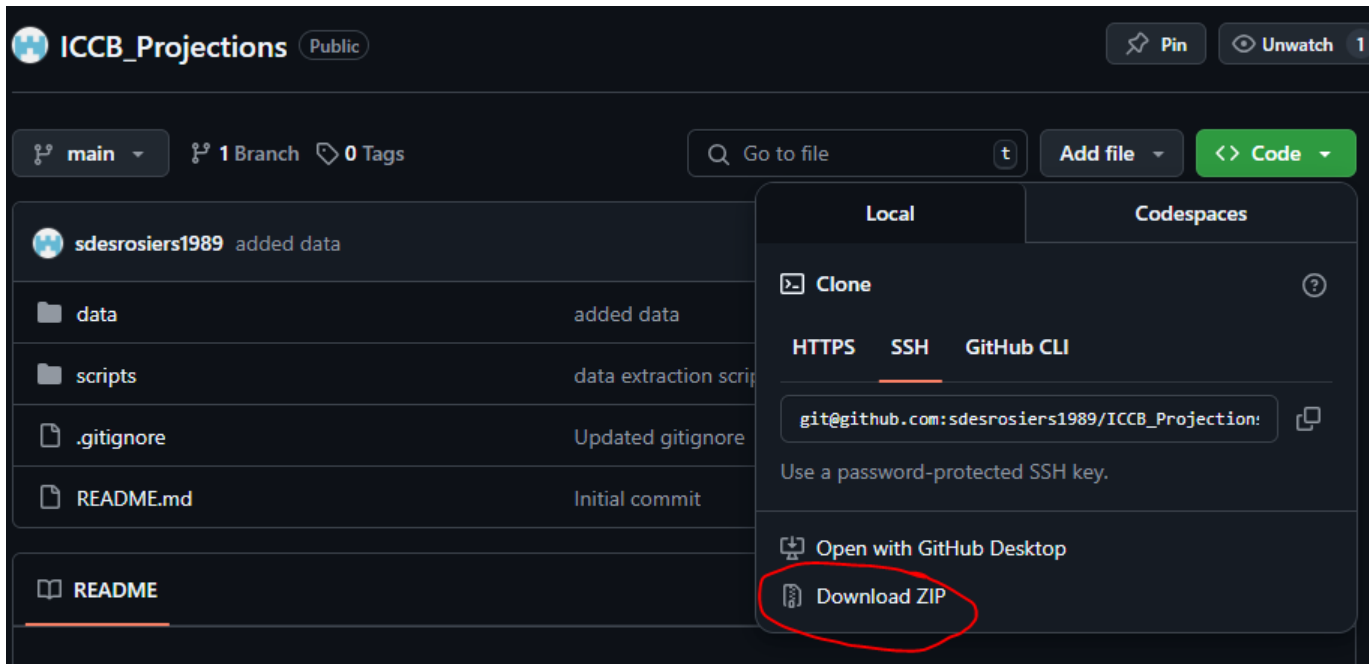

Questions?

Getting started

https://github.com/sdesrosiers1989/ICCB_Projections

git@github.com:sdesrosiers1989/ICCB_Projections

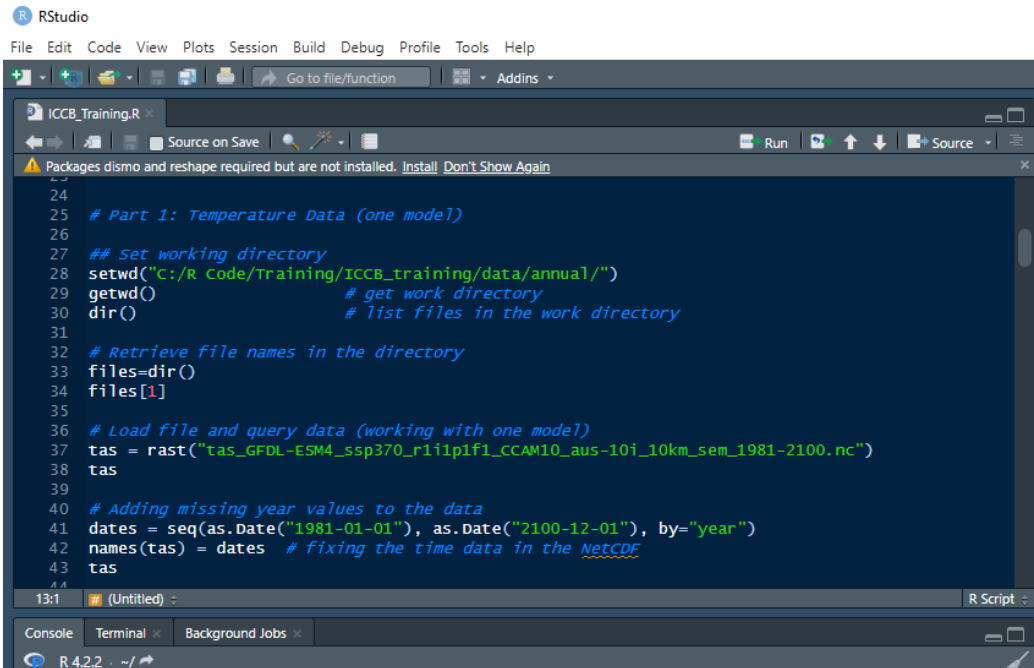

Use a password-protected SSH key.

Open with GitHub Desktop

Download ZIP

Prepare your files

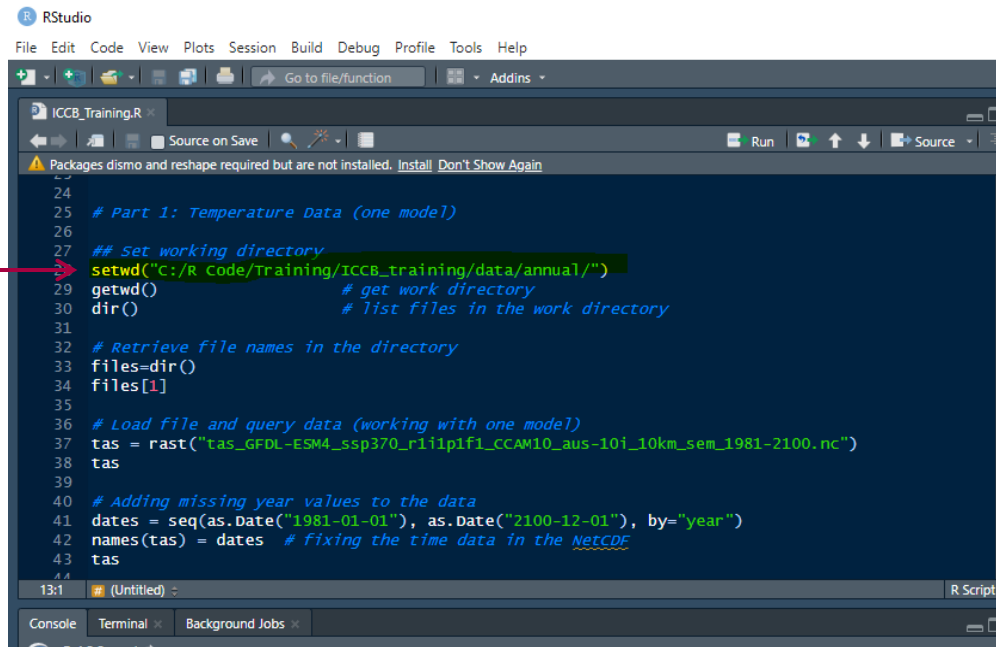

- Unzip the folder
- Move it to wherever you want it (make sure you can find it!)
- Open RStudio
- In RStudio, open the script 'ICCB_Training.R'

```
RStudio
File Edit Code View Plots Session Build Debug Profile Tools Help
Go to file/function
Addins
ICCB_Training.R
Warning: Packages dismo and reshape required but are not installed. Install Don't Show Again
24
25 # Part 1: Temperature Data (one model)
26
27 ## Set working directory
28 setwd("C:/R Code/Training/ICCB_training/data/annual/")
29 getwd() # get work directory
30 dir() # list files in the work directory
31
32 # Retrieve file names in the directory
33 files=dir()
34 files[1]
35
36 # Load file and query data (working with one model)
37 tas = rast("tas_GFDL-ESM4_ssp370_r1i1p1f1_CCAM10_aus-10i_10km_sem_1981-2100.nc")
38 tas
39
40 # Adding missing year values to the data
41 dates = seq(as.Date("1981-01-01"), as.Date("2100-12-01"), by="year")
42 names(tas) = dates # fixing the time data in the NetCDF
43 tas
44
13:1 (Untitled) R Script
Console Terminal Background Jobs
R 4.2.2 ~/
```

Set your working directory

- Install any packages you are missing (code at the beginning of the script)
- Import your packages
- Change wd to where you put the data
- `dir()` should now show you the data files

```
RStudio
File Edit Code View Plots Session Build Debug Profile Tools Help
Go to file/function Addins
ICCB_Training.R
Warning: Packages dismo and reshape required but are not installed. Install Don't Show Again
24
25 # Part 1: Temperature Data (one model)
26
27 ## Set working directory
28 setwd("C:/R_code/Training/ICCB_training/data/annual/")
29 getwd() # get work directory
30 dir() # list files in the work directory
31
32 # Retrieve file names in the directory
33 files=dir()
34 files[1]
35
36 # Load file and query data (working with one model)
37 tas = rast("tas_GFDL-ESM4_ssp370_r1i1p1f1_ccam10_aus-10i_10km_sem_1981-2100.nc")
38 tas
39
40 # Adding missing year values to the data
41 dates = seq(as.Date("1981-01-01"), as.Date("2100-12-01"), by="year")
42 names(tas) = dates # fixing the time data in the NetCDF

```

- Annual temperature and precipitation for Queensland for 3 climate models for SSP370 1981 - 2100

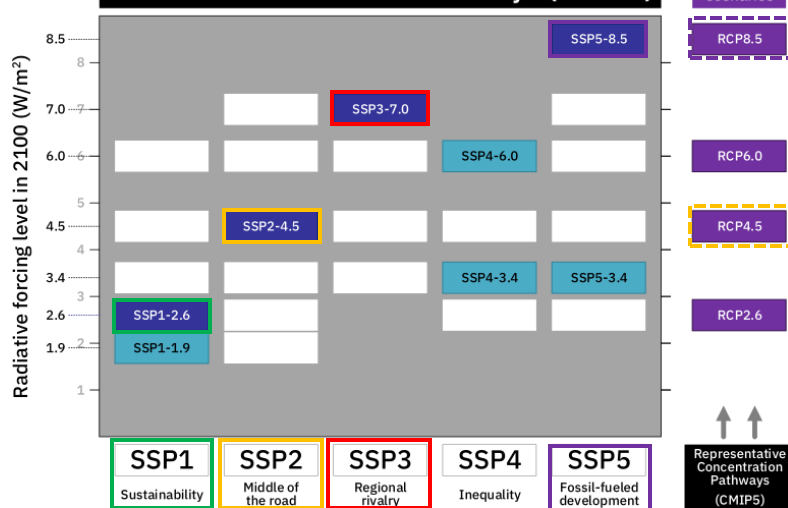

-
- Figure 1 is a scatter plot showing the relationship between the change in annual precipitation (%) on the y-axis and the change in annual temperature (°C) on the x-axis. The y-axis ranges from -40 to 40, and the x-axis ranges from 2.0 to 5.0. A dashed horizontal line at y=0 represents zero change in precipitation. Data points are labeled with letters (A, B, C, D, E, F, G, H, I, J, K, L, M, N, O, P, Q, R, S, T, U, V, W, X, Y, Z) and colors (blue, red, yellow). A legend on the right lists the models corresponding to each letter. A box plot at the bottom shows the distribution of temperature changes for GCMs (blue) and CCAM (red).
- Legend:
- GCM** (Blue)
 - CCAM** (Red)
 - A** ACCESS-CM2 r201p1f1
 - B** ACCESS-ESM1-5 r201p1f1
 - C** ACCESS-ESM1-5 r401p1f1
 - D** ACCESS-ESM1-5 r61p1f1
 - E** CMCC-ESM2 r11p1f1
 - F** CNRM-CM6-1-HR r11p1f2
 - G** EC-Earth3 r11p1f1

 - V** MPI-ESM1-2-LR r91p1f1
 - W** MRI-ESM2-0 r11p1f1
 - X** No-ESM2-MM r11p1f1oc
 - Y** No-ESM2-MM r11p1f1oc
 - Z** CCAM ensemble mean
 - +** CMIP6 ensemble mean

Datasets – climate change scenarios

- **SSP1-2.6**: Sustainability
- **SSP2-4.5**: Middle of the road
- **SSP3-7.0**: Regional rivalry

Tier 1 = baseline scenarios **Tier 2** = additional scenarios of interest

Shared Socioeconomic Pathways (CMIP6)

CMIP6 Scenarios - Anthropogenic Radiative Forcing (W/m^2)

CMIP6 Scenarios - Global CO_2 Emissions (Gt/Year)

CMIP6 Scenarios - Global CO_2 Concentrations [ppm]

Warming by scenario in current CMIP6 model runs

For currently available runs, from 1880-1900 to 2090-2100.

Part 1: What does your data look like?

Your turn!

- Can you modify this plot? Add a title, modify the colours
- Can you plot the other models? How do they compare to this one?
- Hints:
 - `plot(main = "title")`
 - `plot(col=brewer.pal(11, "YlOrRd"))`. See <https://colorbrewer2.org/> for ideas!
 - plot multi-panel figures using `par(mfrow = c(nrows, ncols))`
 - R is widely used – there's lot of information on the internet!

What does your data look like?

Do these values make sense?

Want to customize your plot further?

<https://ggplot2.tidyverse.org/articles/ggplot2.html>

ggplot2 is a very popular package. You'll find many examples online!

Part 2: What does your data look like?

Do these values make sense?

How does the ensemble mean compare to the values for individual models?

Your turn!

- Can you modify this plot? Add a title and change the colours.
- Can you plot multiple models on one figure? Is that helpful?
- What do the other scenarios look like? SSP126 and SSP245 are in the data folder. Try plotting them!
- There's lots of information available online:
 - <https://oscarperpinan.github.io/rastervis/#levelplot>
 - <https://colorbrewer2.org/>

Part 3: Validation and Bioclimatic indicators

- Indices relevant to species which are derived from monthly rainfall and temperature

- BIO1** = Annual Mean Temperature
- BIO2** = Mean Diurnal Range (Mean of monthly (max temp - min temp))
- BIO3** = Isothermality ($\text{BIO2}/\text{BIO7}$) ($\times 100$)
- BIO4** = Temperature Seasonality (standard deviation $\times 100$)
- BIO5** = Max Temperature of Warmest Month
- ~~**BIO6** = Min Temperature of Coldest Month~~
- ~~**BIO7** = Temperature Annual Range ($\text{BIO5} - \text{BIO6}$)~~
- BIO8** = Mean Temperature of Wettest Quarter
- BIO9** = Mean Temperature of Driest Quarter

- BIO10** = Mean Temperature of Warmest Quarter
- BIO11** = Mean Temperature of Coldest Quarter
- BIO12** = Annual Precipitation
- ~~**BIO13** = Precipitation of Wettest Month~~
- BIO14** = Precipitation of Driest Month
- BIO15** = Precipitation Seasonality (Coefficient of Variation)
- ~~**BIO16** = Precipitation of Wettest Quarter~~
- BIO17** = Precipitation of Driest Quarter
- BIO18** = Precipitation of Warmest Quarter
- BIO19** = Precipitation of Coldest Quarter

Input data

- GFDL-ESM4 model – monthly tasmax, tasmin, precipitation
 - Due to the size of this dataset we've subset it to SEQ
 - Tomorrow you will use bioclimatic indicators based on a bias-corrected and statistically downscaled version of this dataset
- Statistical downscaling
 - Process of downscaling that relies on statistical relationships between the model and observations in the historical period
 - Assumes relationship remains the same in the future

What does your data look like?

Validating the data

- Ensure observations and modelled data are
 - Spatial resolution
 - Temporal resolution
- Quantifying performance:

$$RMSE = \sqrt{\left\{ \sum_{i=1}^n \frac{(\{model\}_i - \{obs\}_i)^2}{n} \right\}}$$

$$MAPE = \left\{ \frac{1}{n} \sum_{i=1}^n \left| \frac{\{model\}_i - \{obs\}_i}{\{obs\}_i} \right| \times 100 \right\}$$

Spatial Averages

- Average of cut raster considers all cells
- **terra::extract** weights the mean by the area within the shapefile
- More precise results, especially for smaller shapefiles

What does your data look like?

- What are the final bioclimatic indicators?
- How are they changing over time?
- Do these changes make sense?

Final tips

- There's a lot of data available. Think about the question you're asking and what you need before getting the data.
- Always check your units
- Plotting is a good way to check your data to make sure the numbers make sense
- Calculate ensemble average at the end!
- If you work with python and R – the indexing is different!
